

Day 2: Population growth, species interactions and time series

Day 2: Population growth, species interactions and time series

Please:

This course is for you!

Please interrupt us as often as needed.

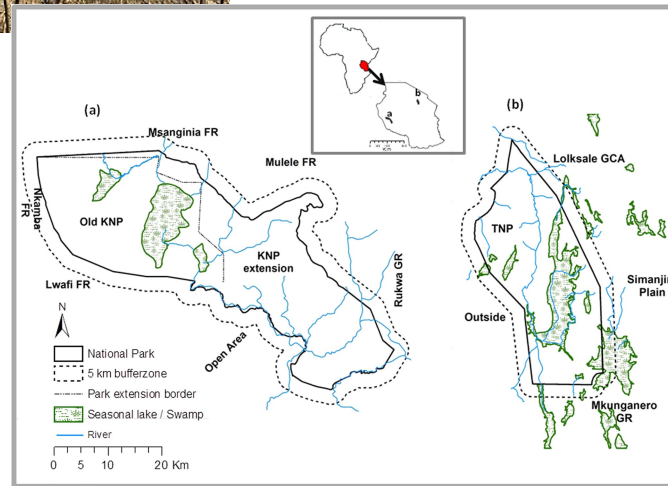

Please give us feedback during and after the course.

Day 2: Population growth, species interactions and time series

Schedule:

- | | |
|---------------|---|
| 09:00 – 10:00 | Introduction (Emanuel Fronhofer) |
| 10:15 – 11:15 | Fitting population dynamics in stan/rstan (Jhelam Deshpande) |
| 11:30 – 12:30 | Introducing process error and state-space models (Benjamin Rosenbaum) |
| 14:00 – 17:00 | It's your turn! |
| 17:00 – 17:30 | Fitting multiple time series at once (Jhelam Deshpande) |
| 18:00 – 19:00 | Evening lecture: Frédéric Barraquand |

Global Population Dynamics Database

General

Identifier: d39b:240.11

Abstract: As a source of animal and plant population data, the Global Population Dynamics Database (GPDD) is unrivaled. Nearly five thousand separate time series are available here. In addition to all the population counts, there are taxonomic details of over 1400 species. The type of data contained in the GPDD varies enormously, from annual counts of mammals or birds at individual sampling sites, to weekly counts of zooplankton and other marine fauna. The project commenced in October 1994, following discussions on ways in which the collaborating partners could make a practical and enduring contribution to research into population dynamics. A small team was assembled and, with assistance and advice from numerous interested parties we decided to construct the database using the popular Microsoft Access platform. After an initial design phase, the major task has been that of locating, extracting, entering and validating the data in all the various tables. Now, nearly 5000 individual datasets have been entered onto the GPDD. The Global Population Dynamics Database comprises six Tables of data and information. The tables are linked to each other as shown in the diagram shown in figure 3 of the GPDD User Guide (GPDD-User-Guide.pdf). Referential integrity is maintained through record ID numbers which are held, along with other information in the Main Table. Its structure obeys all the rules of a standard relational database.

Abstract

Ecology in principle is tied to evolution, since communities and ecosystems result from evolution and ecological conditions determine fitness values (and ultimately evolution by natural selection). Yet the two disciplines of evolution and ecology

Evolutionary Ecology Research, 2012, **14**: 627–665

**The struggle for existence: how the notion of
carrying capacity, K , obscures the links
between demography, Darwinian evolution,
and speciation**

Back to basics: exponential growth, logistic growth and inter-specific competition

How should we fit such models?

$$\frac{dN}{dt} = r_0 \left[1 - \left(\frac{N}{K} \right)^\theta \right] N$$

least-squares

The theta-logistic is unreliable for modelling most census data

Fig. 2. Bimodality of fitted θ and relationship with r_m . (a) Fitted θ for 1000 simulations of 20 time-steps length, with generating model parameters: $r_m = 0.5$, $\theta = 1.0$, $\sigma = 0.1$ and $K = 100$ (vertical line at generating $\theta = 1.0$). Trace shows the effect of 10% measurement error (ME) applied to the abundance values; (b) \log_{10} - \log_{10} scatter plot of fitted $[r_m, \theta]$ pairs.
